LOGISTICS, DELIVERY & RETURNS INTELLIGENCE

ONE-PAGE EXECUTIVE INSIGHTS / PYTHON ANALYTICS

Ian Ocampo | Business & Digital Systems Integrator | Data Analytics & Business Intelligence

15,000	77.87%	4.00 DAYS	8.00%	85 / 85
ORDERS	RECORDED DELIVERED	BASELINE LEAD TIME	RETURN REQUESTS	VALIDATION PASSES

SEVEN VERIFIED FINDINGS

1. Shipment mix: 11,680 Delivered, 2,694 In Transit, 465 Returned to Sender, and 161 Lost.

2. Delivery baseline: 11,122 eligible observations averaged 4.00 days; screening reduced the sample to 5,667 (4.02 days).

3. Courier comparison: Small mean differences and a screen-sensitive ordering do not establish a superior courier.

4. Return requests: 1,200 of 15,000 orders have requests (8.00%); request and completed return are different outcomes.

5. Leading reason: Changed mind accounts for 182 requests (15.17%), not a majority of requests.

6. Category association: Home & Kitchen: 352 / 4,076 orders (8.64%); the returned item is not identified.

7. Data quality: Payment-before-order (7,436), shipping-before-order (7,397), and status/date conflict (3,707) flags overlap.

TWO PRIORITY RECOMMENDATIONS

01 RECONCILE CHRONOLOGY & STATUS

Cross-check order, payment, shipping, delivery, and cancellation events. Track exception rates and resolution before enforcing SLA benchmarks.

02 CAPTURE RETURNED-ITEM EVIDENCE

Record exact product-line IDs, validated reasons, and request/completion states before calculating item-level category return rates.

Interpretation: Descriptive synthetic-data measures, not verified on-time SLAs, causal courier effects, or completed item-level returns.
